

Time Trends Findings

Presentation 2

Julia, Sophia, and Varun

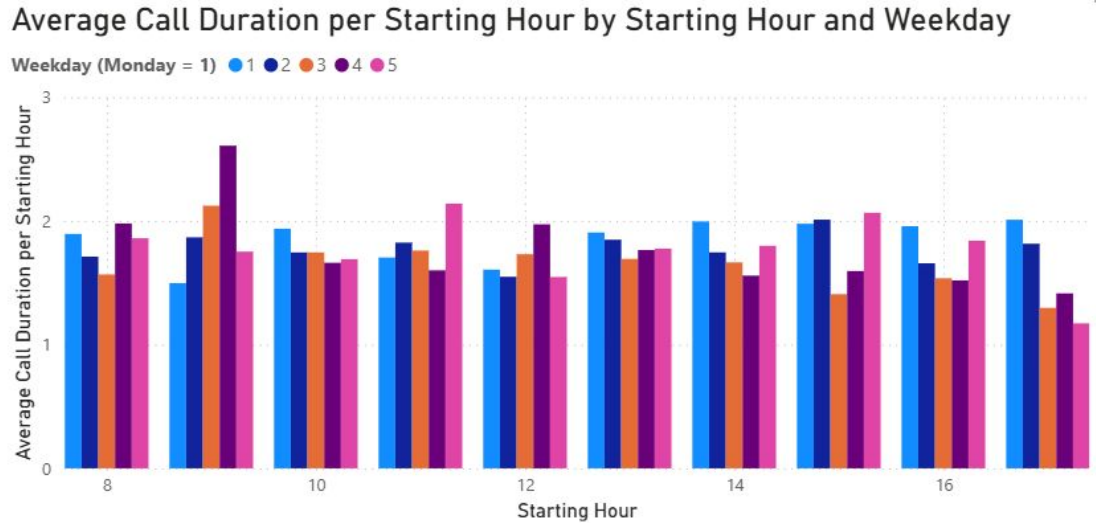

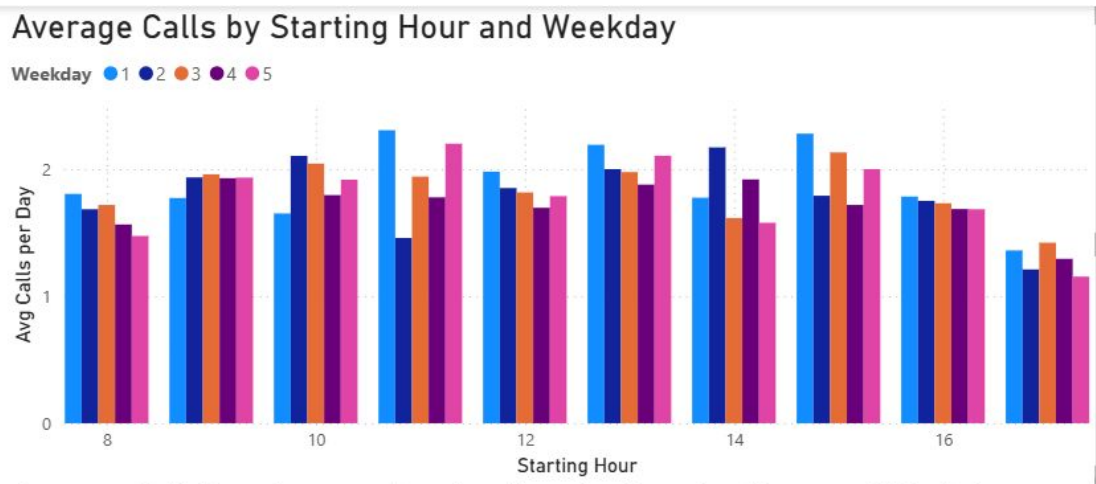

Recommendations

1. Optimize staffing schedules to match call volume and duration trends, improving efficiency and customer experience (see slide 6 for specifics)
2. Introduce Customer Notification and Confirmation Options that allow customers to confirm or reschedule their callback time through an additional phone prompt.

Call volumes and durations peak in the morning, as well as towards the beginning of the week, with exception

- Most menus show a consistent pattern:
 - High call volume and longer durations in the morning, followed by a steady decline throughout the day.
 - Skewed because users are encouraged to call first thing in the morning
- Call times and durations also tend to be higher at the beginning of the week compared to the end of the week
- Upon analysis, select menus exhibit different trends
 - Understanding when call volume and duration peak helps with staffing optimization and availability planning.

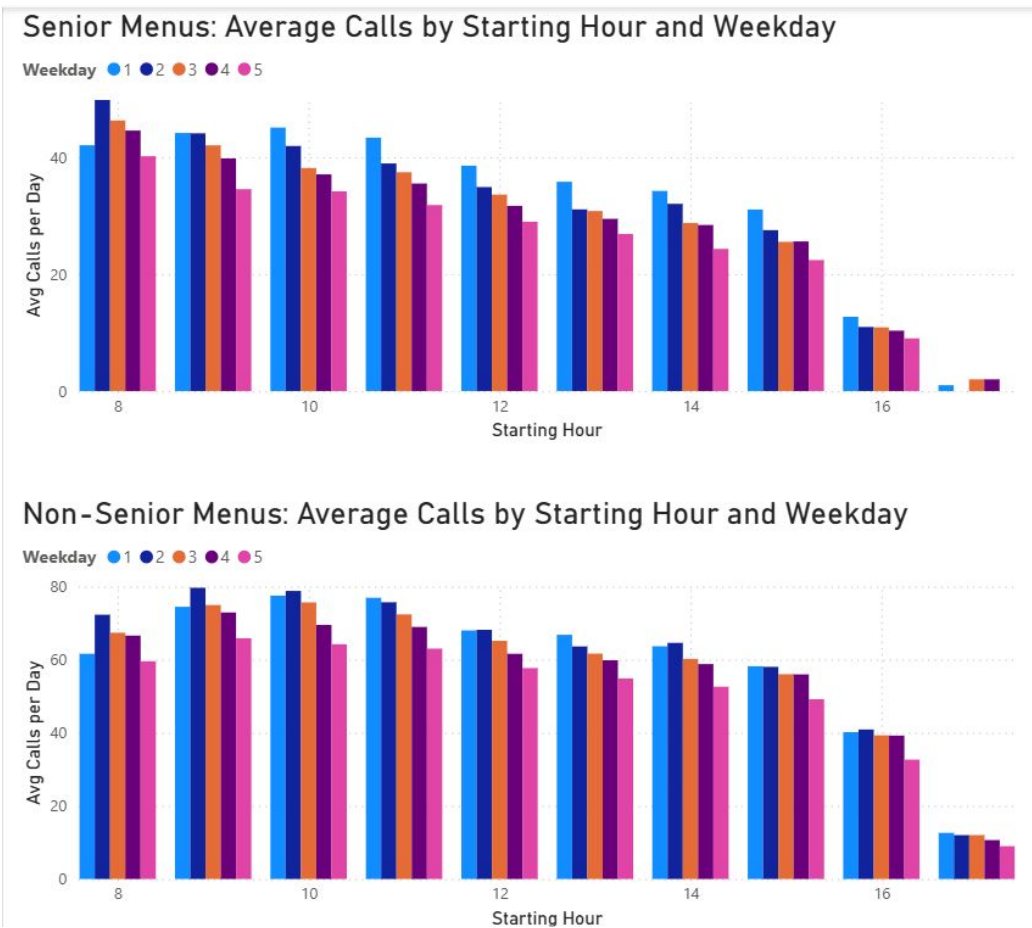

StaffDirectorySpanishTransfer menu peaks later in the day compared to other menus, indicating different engagement timing among Spanish-speaking callers.

 - > ☒ StaffDirectorySpanishTransfer

Calls to the Seniors menu and its submenus show significantly higher average durations and peak earlier in the day, suggesting these interactions are more complex and time-sensitive than other caller groups.

58.83

Seniors: Average Call Duration

27.76

Non-Seniors: Average Call Duration

Optimize staffing schedules to align with call behavior patterns and improve response efficiency.

- Increase staffing coverage in the **mornings and early in the week** to match the higher call volume and longer call durations during these peak periods.
- Extend **Spanish-speaking** staff availability later in the day to better accommodate the later activity peak among Spanish-speaking callers.
 - Coverage from 11 am to 3 pm is essential
- Allocate additional training and support staff to **Seniors** menu topics, and schedule staff trained in these areas to work morning shifts, since these calls tend to be longer and peak earlier in the day, indicating higher complexity and support needs.

Callback volume is heavily concentrated in the early morning and drops throughout the day.

- Due to the high callback volume early in the morning, a large share of callbacks are not picked up.
 - Despite the number of callbacks dropping later in the day, a large portion of callbacks are still not being picked up.
- Reveals inefficiencies in callback timing.
 - Customers may be less likely to answer during peak scheduling periods.
 - Results in missed connections and wasted queue capacity.

Across all hours, more calls go unanswered than picked up.

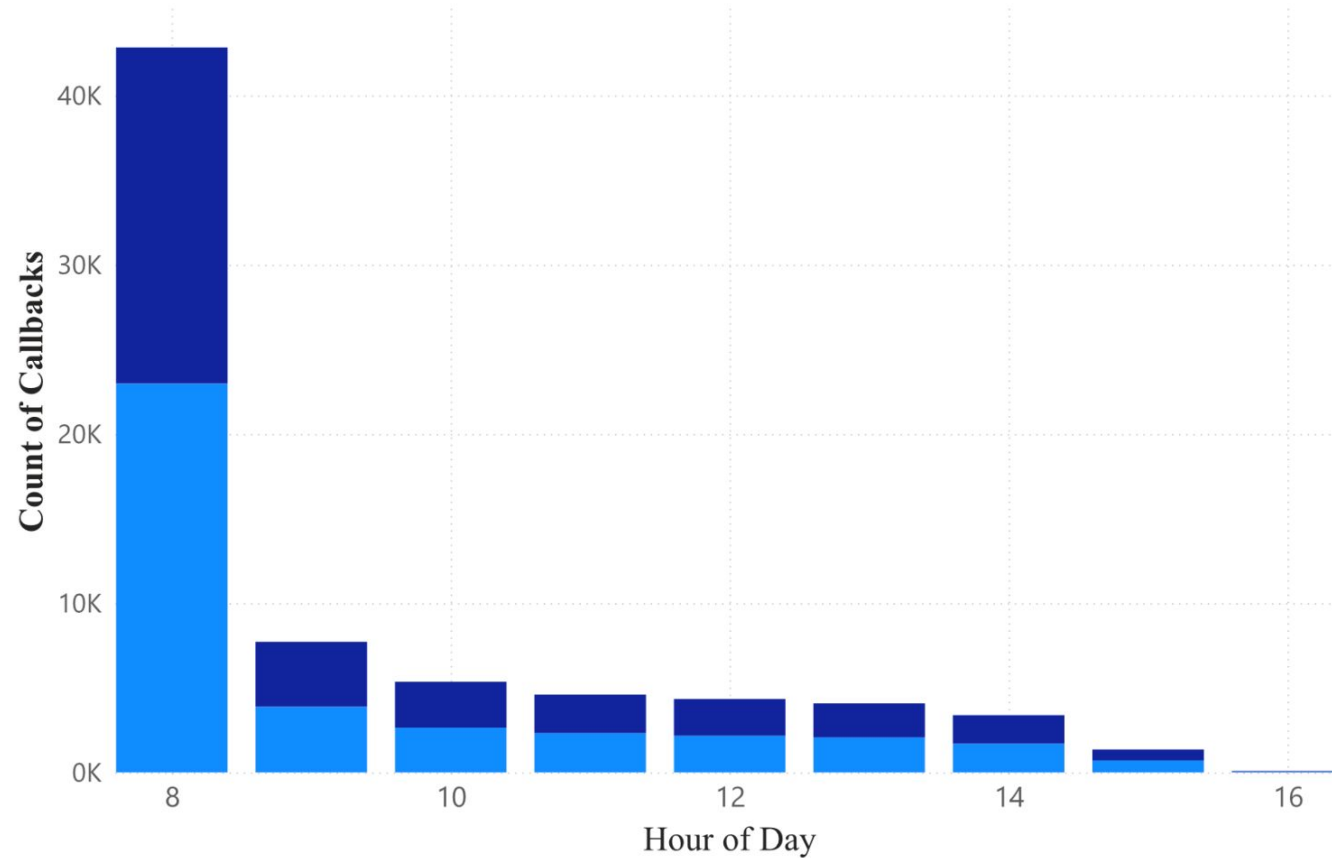

Number of Callbacks Picked Up per Hour

Introduce Customer Notification and Confirmation Options.

- Enable customers to confirm or reschedule their callback time through another phone prompt.
 - “You are scheduled for a callback shortly – press 1 to confirm or 2 to reschedule”
- Helps ensure that callbacks occur when the customer is actually ready to answer, minimizing missed connections and reducing wasted agent time.
 - Schedule to a time when customers are more frequently available.

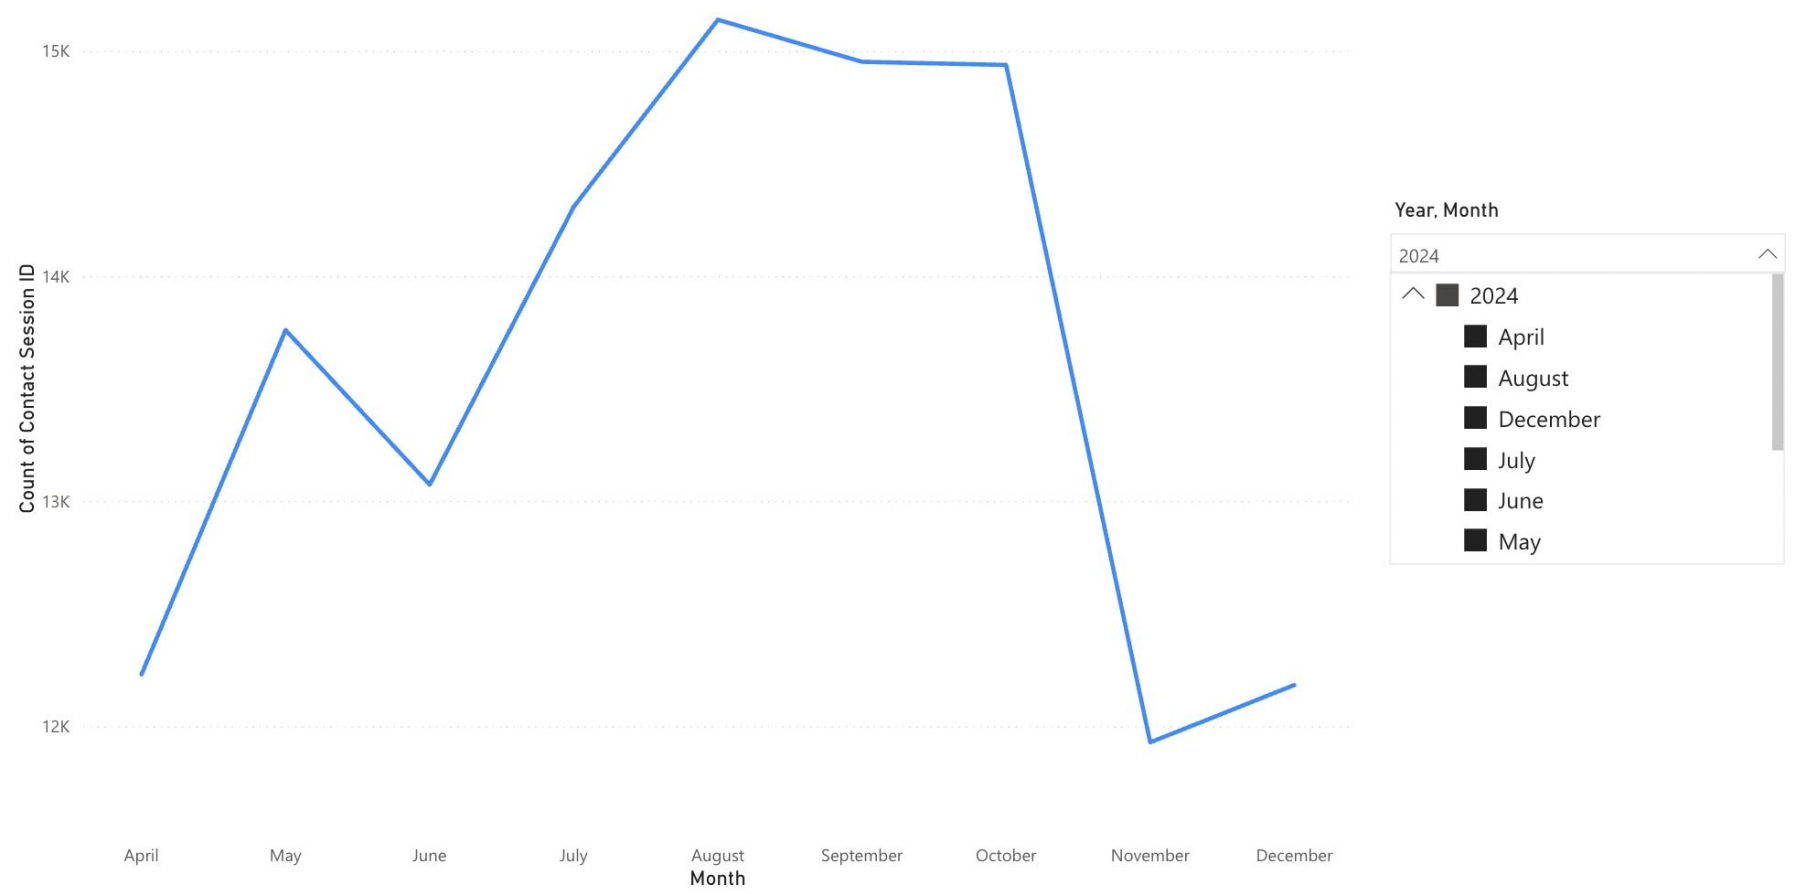

Understanding Call Spikes Is Key to Doing More with Less

- Legal aid already operates on thin budgets, and shifting policies and a volatile economy make grants and donations unpredictable
- Call volumes often exceed capacity—many people seeking help can't get through or face long wait times
- Demand likely does not rise evenly; it likely spikes at specific times—certain days, weeks, or policy moments see surges while others stay quiet
- By understanding and anticipating these spikes, resources can be allocated when they're needed most—helping the organization serve more clients without increasing costs

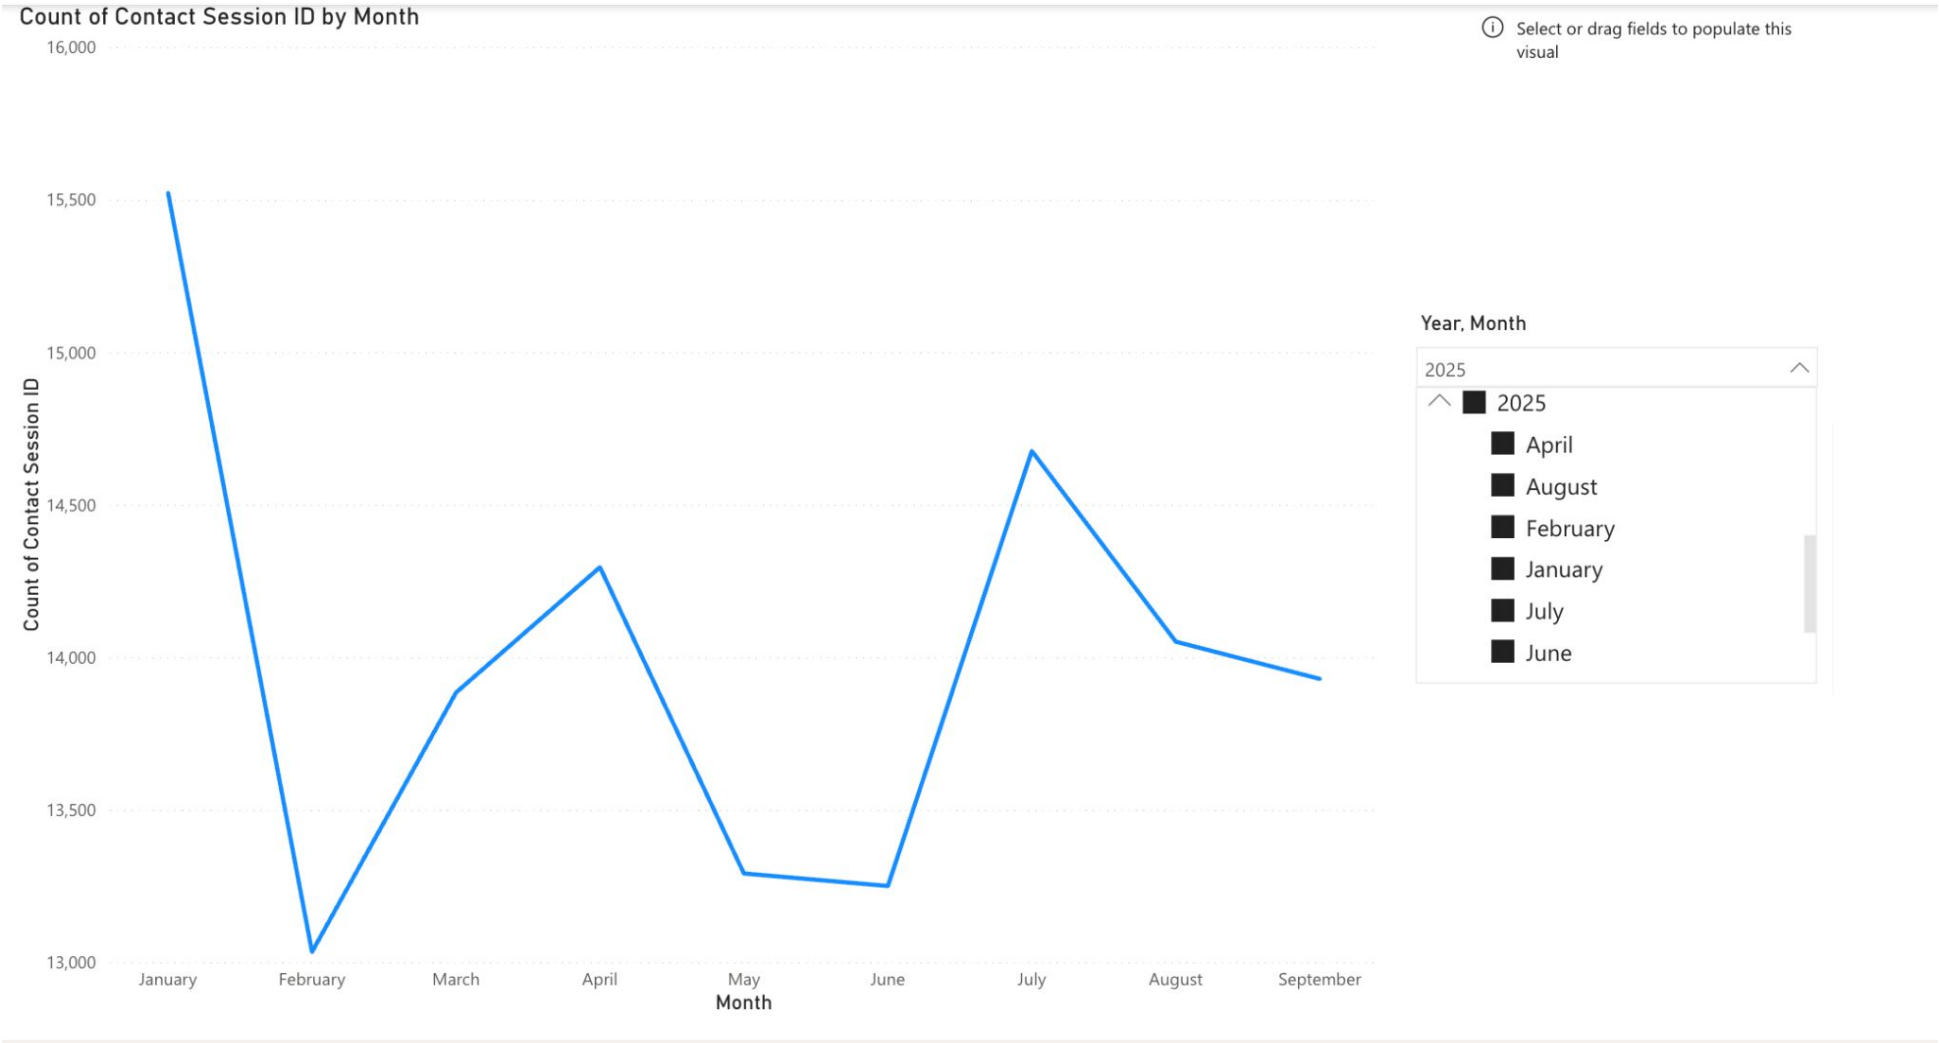

Call volume slightly increased during summer 2024

Count of Contact Session ID by Month

Select or drag fields to populate this visual

Call volume are slightly less in 2025 compared to peak of 2024

We have a hypothesis that we want to test next

- We want to know why there seems to be an average of one to two thousand per month call drop off between most of 2024 and 2025
- Curious if certain reasons people call are less frequent, harder to talk about, or harder to access help for (i.e. immigration, HIV, etc.)
- Findings could help Legal Aid develop more adequate resources for or ways of reaching those who are not calling for help while freeing up agents to answer other calls

Next Steps

- Add hierarchical filtering for queues in Power BI and develop targeted recommendations by building similar visuals to display queue sessions/durations against time of day and weekday.
- Implement a hierarchical filter for Agent Name to examine and compare the performance of individual agents, to determine which agents have higher callback pickup rates.
- Add hierarchical filtering for EP Name in Power BI before building similar visualizations that display call volume for each EP name against months for the last two years
 - We will then develop targeted recommendations to help Legal Aid better apportion its staff/resources
