

Aggregate Trends Group 2

Presentation 4 | Celena, Logan, Jake

Table of contents

- 01 Data Misalignment(Termination Reason and Callback issues)
- 02 Average time spent talking to an agent
- 03 How much time agents actually spend on calls

Potential Data Misalignment Identified

- In an ideal system, a call should end at the first instance of a row that contains a termination reason

Classifying Normal vs. Irregular Sessions Logic

- Normal session:
 - Only one termination reason that is not repeated
 - `first_termination_time - last_activity_time = 0`
 - Multiple termination reasons only if the final one is `MAX_CALLBACK_RETRY_LIMIT_REACHED`, and prior ones are expected retries like `CUSTOMER_UNAVAILABLE`.
- Irregular session:
 - Multiple termination reasons
 - Termination events not in the expected order (e.g., Customer Left then Agent Left)
 - Long elapsed time after first termination event for these types

```
# Step 3: Classify sessions
session_summary <- session_summary %>%
  mutate(session_type = case_when(
    # 1) Normal if only one termination reason
    termination_count == 1 ~ "Normal",

    # 2) Normal if MAX_CALLBACK_RETRY_LIMIT_REACHED appears in that session's reasons
    map_lgl(termination_reasons, ~ "MAX_CALLBACK_RETRY_LIMIT_REACHED" %in% .x) ~ "Normal",

    # 3) Normal if first_termination_time - last_activity_time == 0
    (first_termination_time - last_activity_time) == 0 ~ "Normal",

    # 4) Everything else is Irregular
    TRUE ~ "Irregular"
  ))
```

Termination Reasons Dashboard Link

- Reveals a potential data logging inconsistency in the CARs dataset, specifically around how call session terminations are recorded
- By identifying and flagging these anomalies, we can establish a more accurate logic for logging call sessions by ensuring that sessions end at the first instance of a termination, rather than lingering on the line and potentially taking time away from getting back to other callers waiting for a callback or picking up incoming calls.

Next Steps

- Assess how these anomalies are affecting operational efficiency
- For example, assess patterns across specific agents and call types to identify whether certain conditions or individuals are driving these anomalies
- Such analyses could inform targeted process improvements or adjustments to the call platform's logging system

Callback Misalignment

Expectation:

- 1) Person requests a callback
- 2) Automated callbacks occur
- 3) If client picks up, connected with an agent
- 4) Attempted callbacks stop after about a week
- 5)

Problem 1: Agent Name and ScreenPop with no call

Takeaways/Solutions

Problem 1:

- Figure out why this is happening
 - System errors
 - Client picks up and hangs up immediately
 - Something else
- Problem 2:
 - 11 instances I could find across dataset(may be more)
 - For data purposes, handled by splitting on the second “LanguageSelectionMenu”
 - On data collection end, figure out why this is happening, repeat caller, system error

Time Spent Talking to an Agent

Note: Another group worked on a very similar problem, so this may be some repeat information.

Base Stats

- Recorded 17758 valid session of talking to an agent
 - Found by detecting multiple occurrences of agent name in succession
- Average of 8.81 to 8.9 minutes per call
 - 8.81 Found by taking the time stamp of that first agent name occurrence, subtracting that from the last agent name occurrence
 - 8.9 got from same process, but subtracting from the end of that session ID
- Note: The math here may not be perfect, but we are confident that the average length of a call is between 7 and 10 minutes, and thats important

Insights

Some napkin math leads you to the conclusion that agents are not on call nearly as much as one would expect.

8.81 minutes per call across 17758 calls gets you ~2606 hours, divided between 8 agents is about 326 hours per agent. That leads to the conclusion that agents are on call for less than an hour a day (approx. 360 work days in last 18 months).

- Agents likely have other responsibilities as well, but this number leads me to believe that there is some sort of error in the recording process of calls or call times

Thank you!
