

AGGREGATE TRENDS PRESENTATION 2

Prepared by: Edwin, Ella, Liv & Tatum

Thursday, October 23rd

Redirection Analysis

Understanding how and why calls are redirected for the top called numbers.

1. Define Webex redirection fields
2. Example call path
3. Redirect vs. original reasons (top numbers)
4. Granular front desk analysis
5. Recommendations
6. Next Steps

Each call can generate multiple legs, redirections help explain how calls move through the system.

Call Start

- **Calling Number** → number that initiates the call
- **Direction = TERMINATING** → indicates the call is inbound
- **Correlation ID** → groups all call legs of the same session

Call Movement

- **Called number** → initial recipient
- **Redirecting Number** → who last redirected the call
- **Original Reason** → first trigger for a redirection
- **Redirect Reason** → why subsequent redirection occurs
- **Related Reason** → the trigger that led to a change in call presence

Call End

- **User Type** → identifies the endpoint (User, Voicemail, etc.)
- **Answered** → whether the call was answered or not
- **Report Time** → when the call ended

Call Path for Correlation ID '9108b891-9c8f-4056-a98c-dea3d0a121a8' (March 2025).

Client initially calls the Ombudsman Nursing Home line.

Called number =
13122296079, Nursing Home

Direction = Terminating

Original reason = No Answer

Redirecting number =
13123478300

Redirect reason = No Answer

User type = Virtual line

Related reason = Call Forward No Answer

Model = N/A

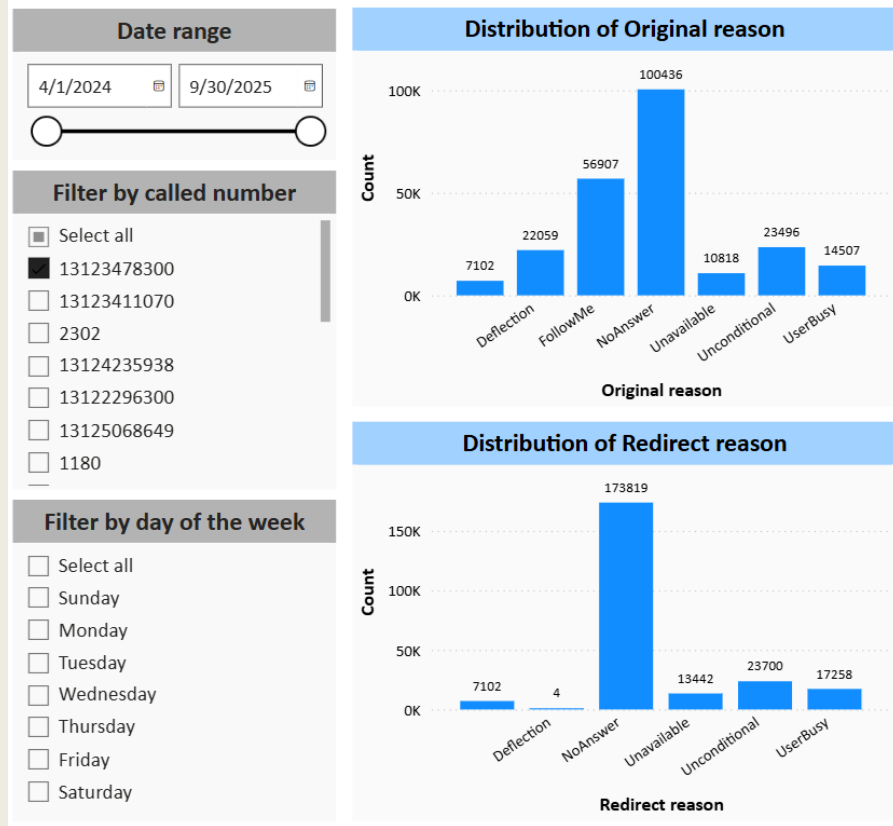

User = Voice Mail Retrieval

Call outcome = SUCCESS

Answered = TRUE

*The call was ultimately “answered”, but not by a person. It was **answered after being redirected to voicemail**.*

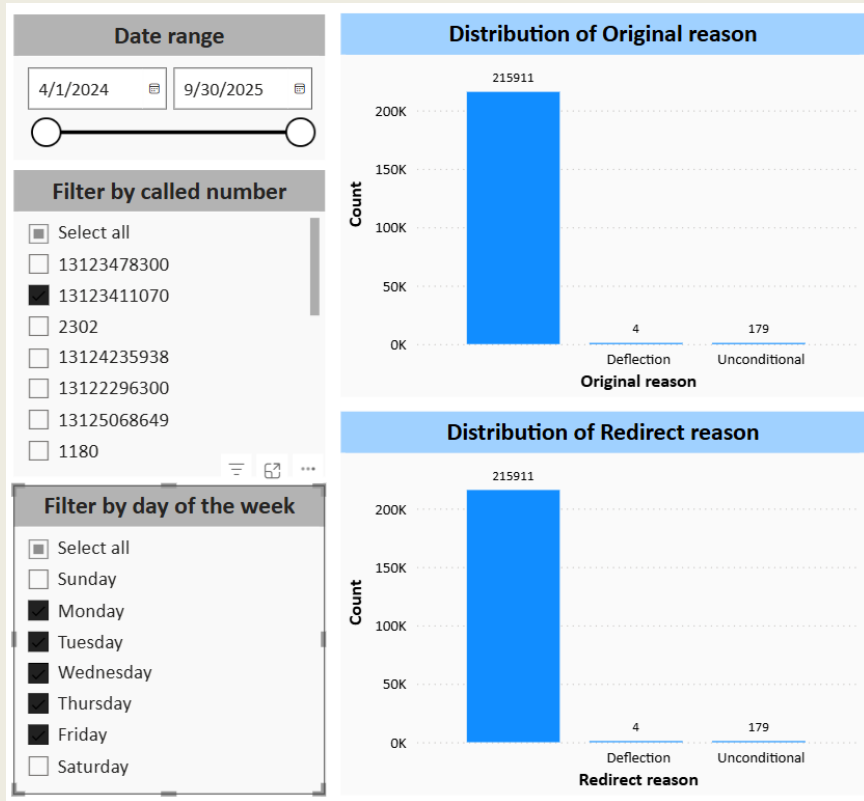

Distributions of original/redirect reasons for internal voicemail (13123478300) reflect its role as the ending leg of failed calls.

What We Found:

- Redirect reason (and original reason) is **predominantly NoAnswer** for internal voicemail, reflecting how it is the **outcome of failed calls**.
- Deflection** is an **extremely rare redirect reason** for 8300 → it is **not the intended outcome**
- A call ending in 8300 could be used as an **indication of failure** → possibly helpful in calculating success rate metrics

Most phone numbers do not significantly differ in their original/redirect distributions between weekday calls and weekend calls.

What We Found:

- For many of the phone numbers that I created as a filter, there is no major difference between their reason distributions on weekdays versus weekends
- Specifying hours of the day to look at will likely be more fruitful than trying to analyze the data at the level of days of the week

Distribution of Original reason

Distribution of Redirect reason

Front desk calls are being answered efficiently, with most actively managed through automatic routing.

Answered vs Not Answered (Front Desk)

Redirect reason for Front Desk Calls

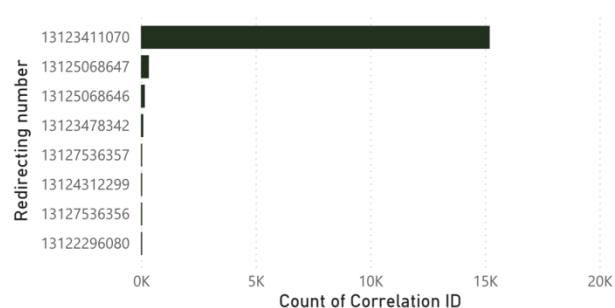

What We Found:

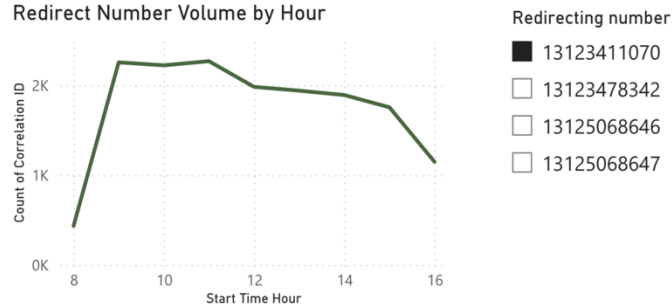

- ~ **97% of front desk calls are answered** showing strong coverage overall
- **The dominant redirect reason is “Follow Me”**, meaning the calls are automatically routed through Webex’s sequential forwarding logic until answered
- **Most redirected calls still reach a person**, showing that automated routing is working effectively to prevent missed calls for this line

Most “Follow Me” redirections from the front desk route through the main number, peaking mid-day and tapering after 4 PM.

Count of Correlation ID by Redirecting number

Redirect Number Volume by Hour

What We Found:

- 15.6k redirected calls route through the **main number (13123411070)**; it seems to act as the system hub
- Specialized menus handle smaller volumes, **Spanish (13125068647)** ~ 347 calls & **English (13125068646)** ~ 170 calls
- Redirect call volumes for the main line from the front desk peak between **9 AM and 2 PM**, aligning with business hours

Recommendations

1

Reallocate agent availability to areas that often result in “No Answer”. This would reduce the rate of calls ending in voicemail. However, practically, this might be infeasible due to costs.

2

Add bilingual auto-menu routing at the front-desk number to reduce unnecessary “Follow Me” transfers. A brief bilingual menu at the front desk entry point would let callers self-select their language immediately, decreasing redirections from this line.

Questions & Next Steps

Open Questions

- What is the Follow Me routing logic in Webex? Can the configuration be accessed directly or can we only infer it through All Call data?
- What are the use cases for callers dialing the front desk directly instead of the main line?

Next Steps

1. **Analyze Patterns Behind Voicemail.** Identify trends in **Reason**, **User Type** and **Client Type** for calls that end in extension 8300 (internal voicemail) to isolate whether missed calls are from staffing gaps or menu inefficiencies.
2. **Expand Use of “Related Reason” Field.** Investigate distinctions between **Deflection** and **Consultative Transfer** to better understand how and why front-desk calls move between lines.

Submenu Analysis

Hierarchical Menu Usage Analysis: Power BI Drill-Down Dashboard

Defining the Hierarchy and Variables Used

EP (Entry Point)

Main menu where a call begins (e.g. Legal Menu, Housing Menu).

Flow

A submenu or routing option under an EP.

Activity

The final action or step reached within a call (e.g. Language Selection, Queue).

Contact Session ID

Unique identifier for each distinct call. Counted each time the ID is within a menu.

Submenu Count

Number of submenus navigated during a single call.

Unknown Values

Placeholder for missing data. Ensures complete hierarchy display.

Preparing the Data for Drill-Down Analysis

What We Did:

- Standardized/combined CAR dataset
- Created submenu_count variable
- Replaced NAs with “Unknown” placeholders
- Converted ep_name, flow_name, and activity_name to text
- Filled missing EPs and Flows by filling from the row above and grouping by contact_session_id

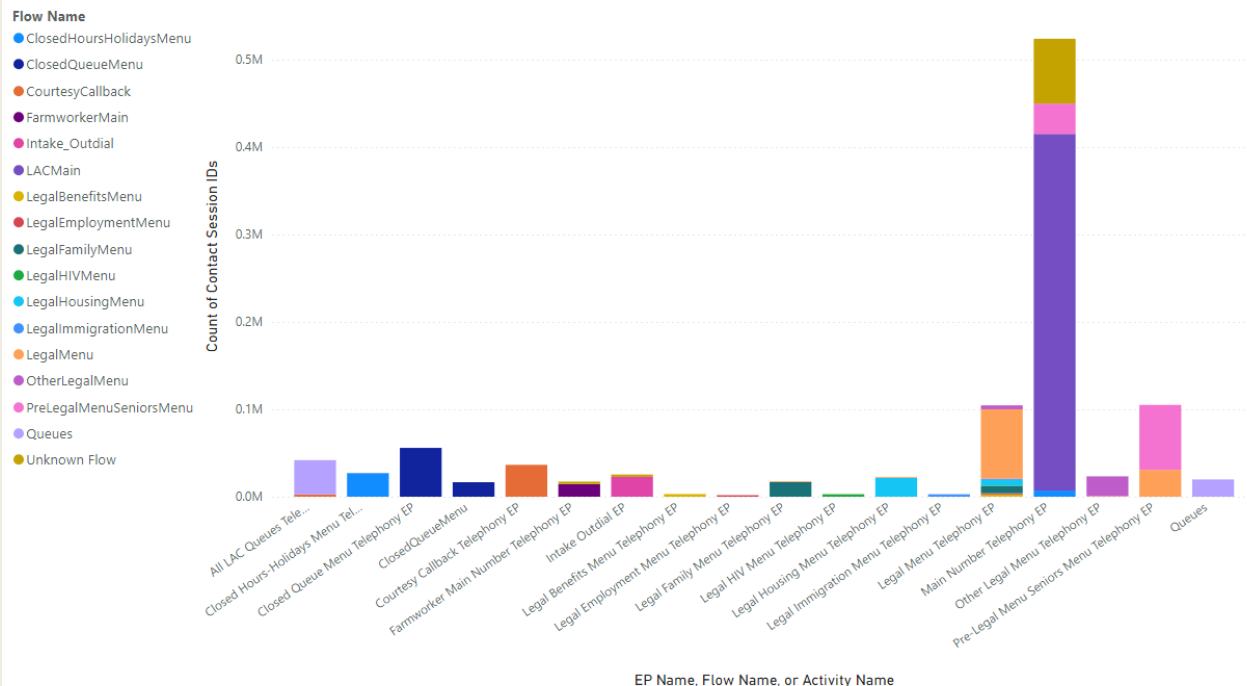

Call Flow Example

Baseline Distribution of Contact Session IDs by EP Name, Colored by Flow Name

Count of Contact Session IDs by EP Name, Flow Name, and Activity Name

What We Found:

- The **Main EP** is visited most frequently; indicates we should prioritize simplifying this EP since it takes extra time to read out all these options
- Under the Main Menu, there are **12 Activity Names**, which takes **58 seconds** to list; separating these activities into 2 groups could improve efficiency
- Benefits, Employment, HIV, Immigration EPs** are rarely used; could combine these to simplify the system then have them be just flows instead of their own EPs

Recommendations

1

Simplify high-complexity menus

2

Develop Menu Efficiency Metrics

3

Reduce Queue-Related Bottlenecks

Next Steps & Further Questions

- Add interactive filters and KPIs: Include slicers for date, day type, and hours; add cards for total calls and average submenus per EP
 - Develop efficiency indicators: Calculate average submenu depth per EP or Flow to highlight areas with the most caller confusion or unnecessary steps
 - Group related menus: Merge similar Eps (e.g. Benefits, Employment, HIV, Immigration) for clearer visualization and comparison
 - Group related activities: there are 12 options inside of Main Menu → splitting into two groups could improve efficiency
1. Does the EP → Flow → Activity hierarchy in our cleaned data match LAC's structure?
 2. Can Cynthia clarify what the Flow Name means?
 3. Would LAC be open to restructuring or merging high-friction menus based on our findings?
 4. Which metrics are most important to LAC between minimizing submenu steps, reducing queue time, or ensuring correct routing on the first try?

Appendix

** Includes additional details and visuals from our analysis that were not included in the live presentation due to time constraints.*

Data Cleaning (Python)

The following data cleaning was completed in **Python** for the **All Calls Dataset**. The new data from *September 2025* was also added to the combined code csv. Code [here](#).

Converting date to datetime format

```
In [59]: df_main["Start time"] = pd.to_datetime(df_main["Start time"], utc=True)
```

```
In [60]: df_main.to_csv("combined_calls.csv", index=False)
```

```
In [61]: df_main["Start time"] = df_main["Start time"].dt.tz_convert("America/Chicago").dt.tz_localize(None)
```

```
In [62]: df_main["Start time"].head()
```

```
Out[62]: 0    2024-04-30 18:58:53.988
1    2024-04-30 18:56:37.386
2    2024-04-30 18:54:59.099
3    2024-04-30 18:54:59.099
4    2024-04-30 18:54:52.336
Name: Start time, dtype: datetime64[ns]
```

```
In [63]: # Extract hour of day
df_main["Start Time Hour"] = df_main["Start time"].dt.hour
print(df_main[["Start time", "Start Time Hour"]].head())
```

	Start time	Start Time Hour
0	2024-04-30 18:58:53.988	18
1	2024-04-30 18:56:37.386	18
2	2024-04-30 18:54:59.099	18
3	2024-04-30 18:54:59.099	18
4	2024-04-30 18:54:52.336	18

```
In [64]: df_main.to_csv("combined_calls_with_start_time_hour.csv", index=False)
```
