

Comprehensive Analysis of New Implementation

Presentation 5 | Celena, Logan, Jake

Table of contents

01 Recap of Menu Changes

02 Discussing the Effects these had on Callers

03 Final Thoughts

Recap of What Changed

Original Menu:

- People are asked if they are a Senior first, with confirmation
 - After Senior confirmation, goes to SuburbsOrCityMenu
 - This leads to SuburbanSeniorsMenu, SeniorsADAPTMenu, or NonCookCoMenu
- Then people traverse through various menus until ending at the LegalMenus

New menu:

- People traverse through various menus first
- After the LegalMenu, they are asked if they are a Senior, with no confirmation
 - After they select Senior, goes to SuburbsOrCityMenu, does not have the following menus (does still have the NonCookCounty Menu)

Impact on Getting rid of Confirmation

Time to get from SeniorsMenu to SuburbsOrCityMenu decreases.

1. Looking at the time it takes to get from the first occurrence of SeniorsMenu to first of SuburbsOrCityMenu, we see a decrease from **23.7 seconds** to about **7.1 seconds**
2. Looking at the time it takes to get from first occurrence of SeniorsMenu to the last of SuburbsOrCityMenu(this accounts for confusion and traversing) we see a lesser decrease, from about **24.1 seconds** to **15.4 seconds**(However, this is almost certainly due to one major outlier)
 - a. The percentage of callers navigating back to the SeniorsMenu after going to another menu increased from 0.08% to 0.42%
 - b. The median call duration for these instances prior to implementation is 8.2 minutes, and after is it 8.1, so they remained around the same.

Impact on Switching Order of SeniorMenu

Proportion of People that reach SeniorsMenu

- Pre Implementation: **43.87%**
- Post Implementation: **26.67%**

Proportion of Seniors that don't abandon call before queue(as a proportion of total calls)

- Pre Implementation: **7.3%**
- Post Implementation: **6.5%**

Proportion of Non Seniors that don't abandon call before queue(as a proportion of total calls)

- Pre Implementation: **17.7%**
- Post Implementation: **19.2%**

Lastly, we did run into an issue after the SuburbsOrCityMenu. In the old data, this menu item was followed up a Suburban or ADAPT Menu(differentiating city vs suburb seniors). The new data does not contain this menu after SuburbsOrCity, so for the most part we cannot differentiate these 2 groups of seniors

Breaking Down the Numbers

1. Far less people are actually reaching the SeniorsMenu, but this does not necessarily mean we are taking less Seniors
 - a. We are down about .8% of Seniors reaching queues, but the assumption would be a bit more than that with more non seniors mistakenly getting into the Senior Menu
 - b. Suggestion: To minimize the non seniors here, add the word “Senior” somewhere in the original SeniorsMenu message so listeners don’t mistake 60 for 16
2. About 1.5% more non seniors are reaching a queue. Answering a question about being a Senior at the start of the call may put doubt in non seniors mind to if they should be there, meaning they abandon the call early
 - a. In turn, answering the normal menu questions about their problem first mean that these people who leave stay on the call if they get to the seniors menu.

Final Thoughts

- The new implementation is working to decrease call time, lowering the time to traverse from SeniorMenu to the next menu by 15+ seconds
 - Removing the confirmation menu does allow more non seniors to make mistakes, especially if they mishear '60' as '16' in the message, though we can't prove how much that is happening through the data
- The rearranging of the menus has both positives and negatives
 - We may lose some senior volume listening through all the options before the Senior Menu
 - However, this loss seems to be made up for in the gain of non seniors sticking around
- The potential loss of some Senior customers should not be of utmost concern, as even in the best case scenario only about 40% of Suburban Seniors were reaching an open queue when they got to the queue stage(60% reached closed)
 - A loss of some Seniors, say if its from 7% to 6% of total callers, in the most extreme scenario would only result in 55% of Suburban Seniors reaching an open queue

Final Suggestions

1. Edit the SeniorsMenu message to include the word 'Senior' to make the age of '60' more clear
 - a. This may add a few seconds, but will still be significantly less than having the full confirmation menu
2. If possible, adding some sort of indication to the data after the SuburbsOrCityMenu to signify if the caller is from the Suburbs or City will help hone in on more specific analysis(The SuburbanSeniorsMenu and SeniorsADAPTMenu did this pre implementation, but those menus are no longer necessary with the change of order)
3. There's still an issue, especially in the non seniors case, of very few people reaching an open queue. Adding some sort of second only callback option for people who get to a ClosedQueue could be valuable.

Thank you!
