
Presentation 3

Will Krew, Yi Hyun Kwon,
Vincent chen

Goal of this presentation

Analysis of Successful Calls in Main Menu + Suggestions

Analysis of Subsequent Visits to Legal Menu

Analysis of Impact of Repetition on Successful Call Rate

Reminder of Definitions

"Goes to the right menu"

Definition

- The caller does not go back to the previous menu → indication of reaching the intended menu

Algorithm

- Multiple non-consecutive instances of the same "Activity Name"

"Fully Listened To"

Definition

- The caller remained in the prompt until the second last option

Algorithm

- Compare prompt length vs duration of call at that prompt/menu

"Successful Call"

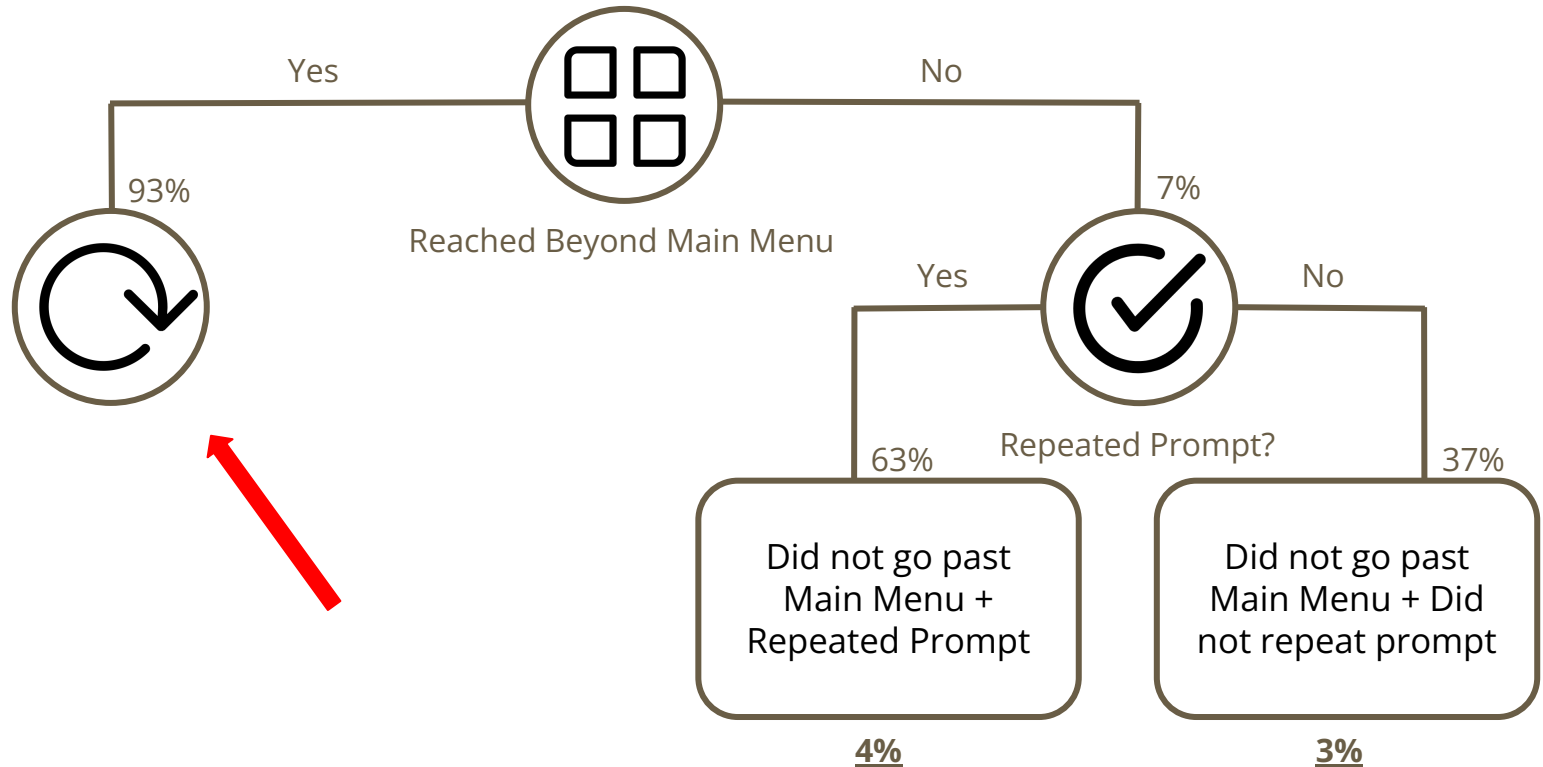

Definition

- The caller reached or entered a queue (include dead-ends for legal menu analysis)

Algorithm

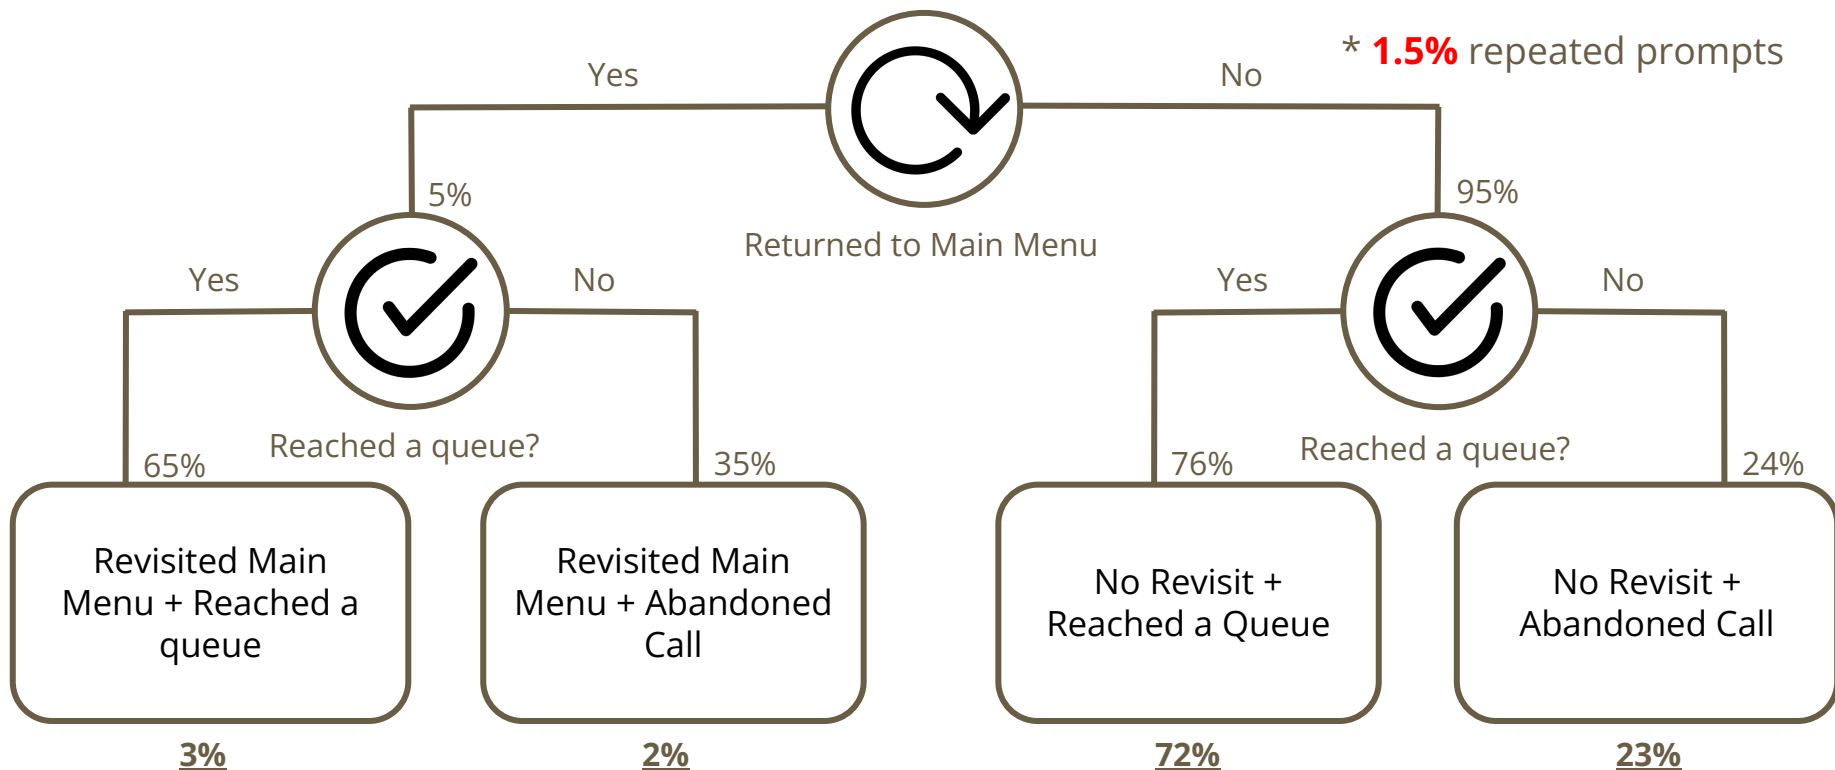

- Check if session reaches "ClosedQueueMenu" or a non empty "Queue Name"

Main Menu Analysis

Main Menu Analysis

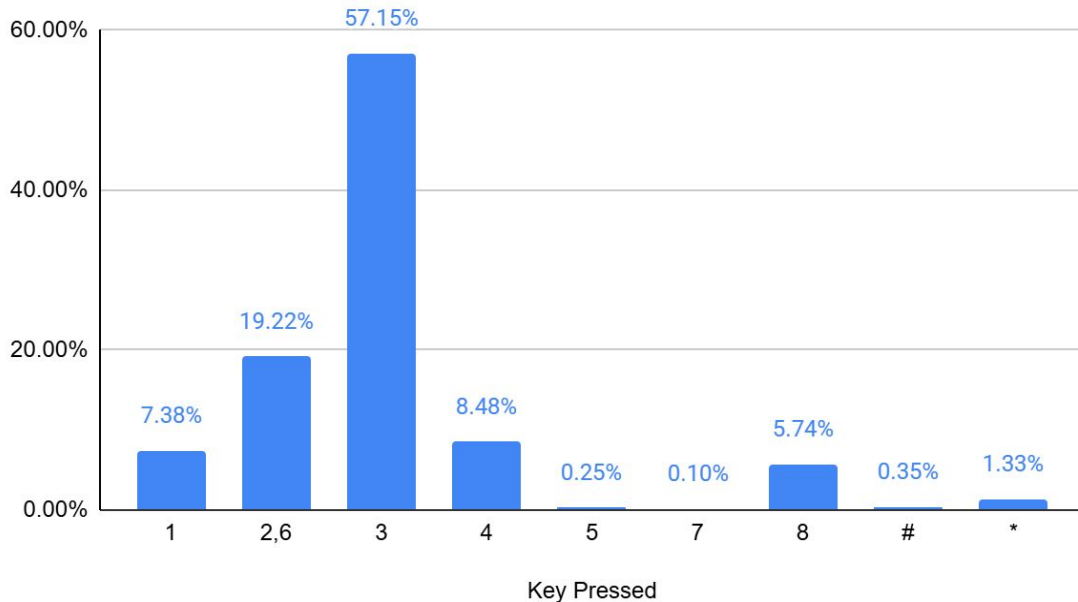

Approximately **50%** of callers that reached a queue connected to an agent

Main Menu Analysis

Approximately **28%** of callers enter a queue right after visiting the Main Menu

Next Activity Breakdown After Main Menu

- | | |
|----|--------------------------------|
| 1. | AppointmentMenu |
| 2. | StaffDirectoryTransfer |
| 3. | SeniorsMenu (LegalMenu2) |
| 4. | ClinicVoicemailTransfer |
| 5. | ComplimentOrComplaintMenu |
| 6. | StaffDirectoryTransfer |
| 7. | AddressFaxHoursMenu |
| 8. | HelpWithLegalorOtherReasonMenu |
| # | No input |
| * | ClosedMenu |

Main Menu Observations/Suggestions

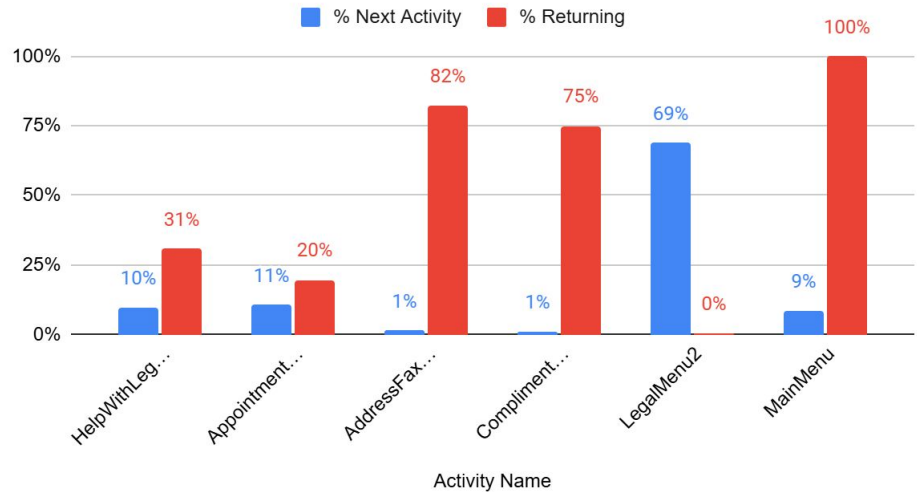

Goal

Given the **high success rate** and **queue options** in MainMenu, simplifying the options would save time and help people navigate to a queue quicker

1. ComplimentOrComplaintMenu and AddressFaxHoursMenu have a **very low visit percentage (near 0%)**, but a **very high return rate**

→ **Get rid of Key 5 and 7**

Percentage of Returning by Activity

Main Menu Observations/Suggestions Cont.

2. Keys 2 and 6 lead to the **same StaffDirectoryTransfer Queue** (27 sec difference)

Key 2: If you are trying to reach the attorney or paralegal you are working with, press 2

Key 6: For our staff directory, press 6

Limitation: CAR data does not show what key the caller pressed but only what activity the caller reaches

StaffDirectoryEnglishTransfer: 17%

StaffDirectorySpanishTransfer: 2%

→ **Majority are English Users**

Solution

Both options help callers connect to a staff

→ **Consolidate the two options**

Main Menu Observations/Suggestions Cont.

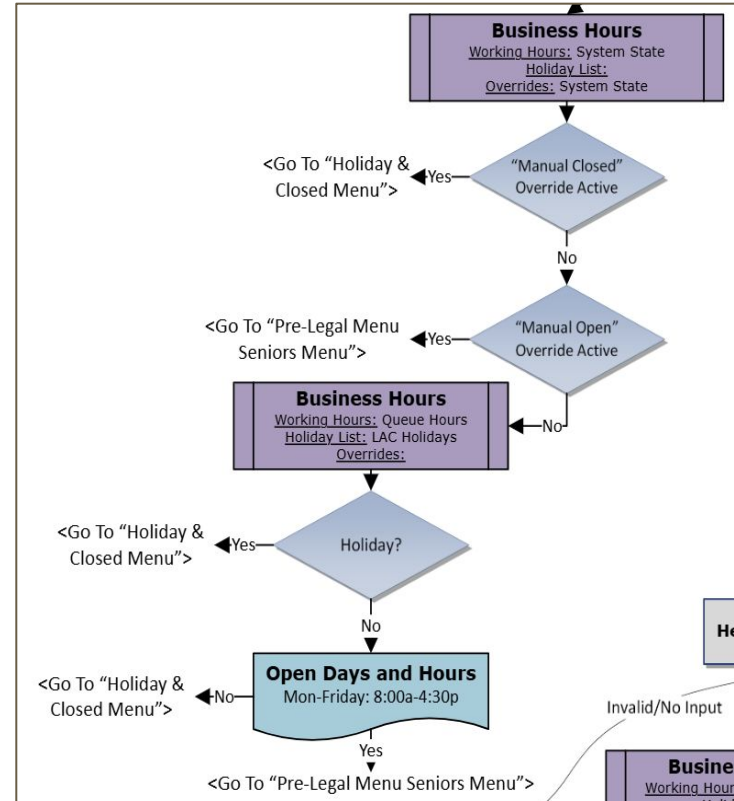

3. Key 3 and option 1 of Key 8 have the **same call flow** (31 sec difference)

* LegalMenu1 Prompt is 34 sec

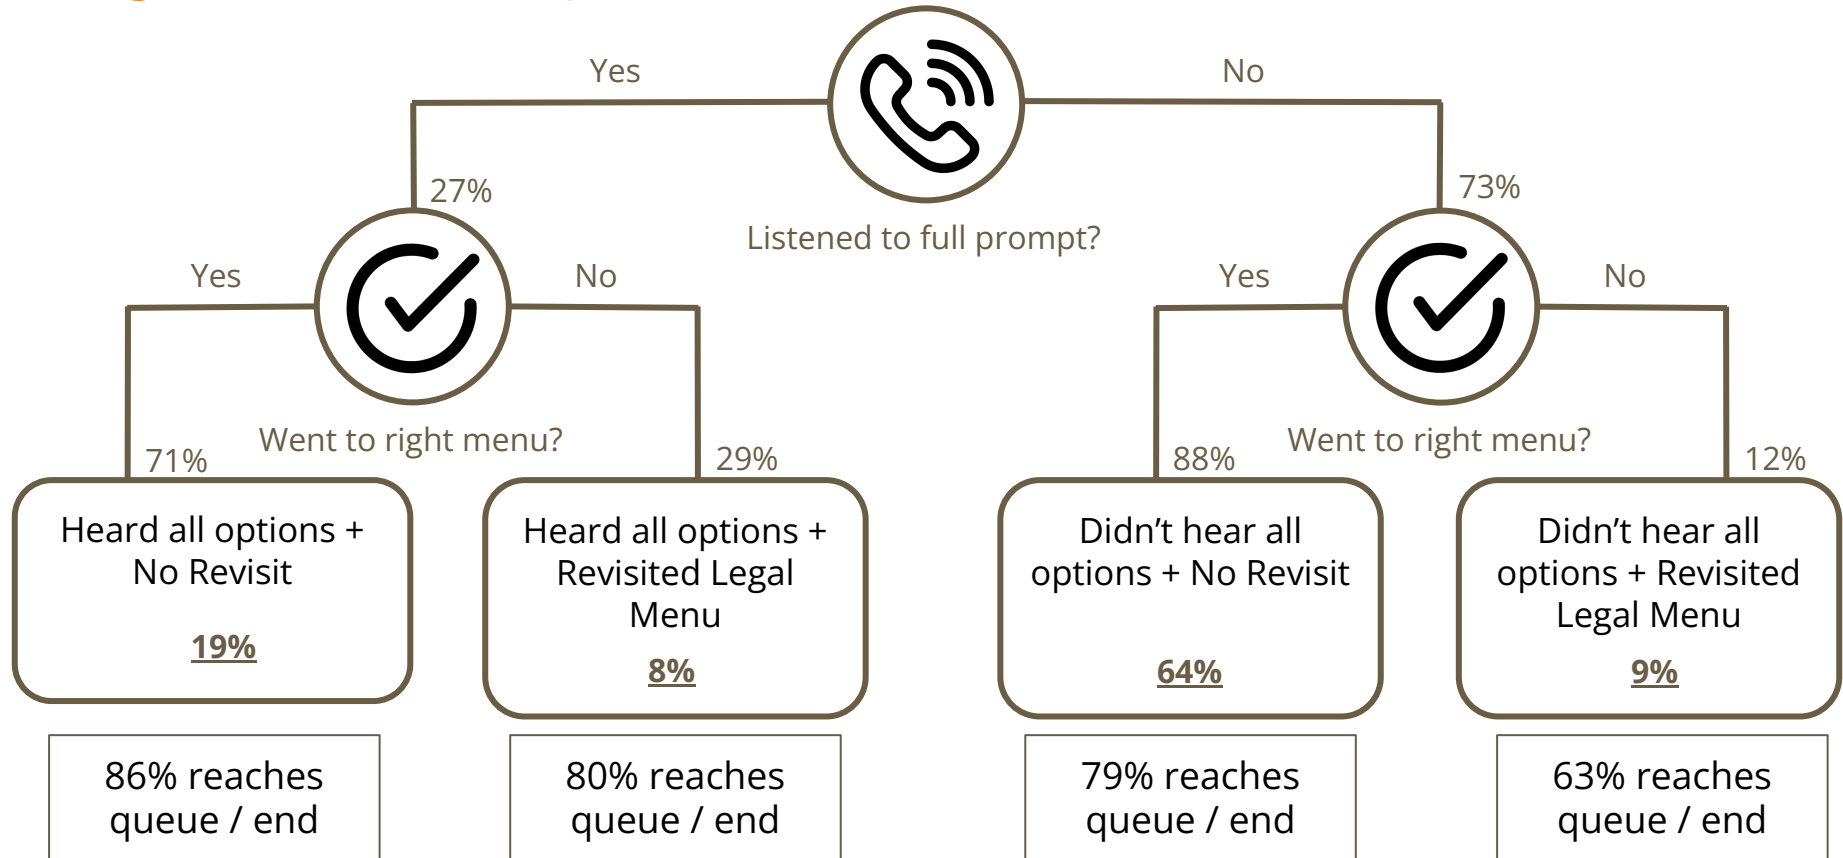

Key 3: If you are calling for help with a legal problem that you have not talked to us about yet, press 3

Options 1 of Key 8: Are you calling for help with a legal problem? If yes press 1, if no press 2

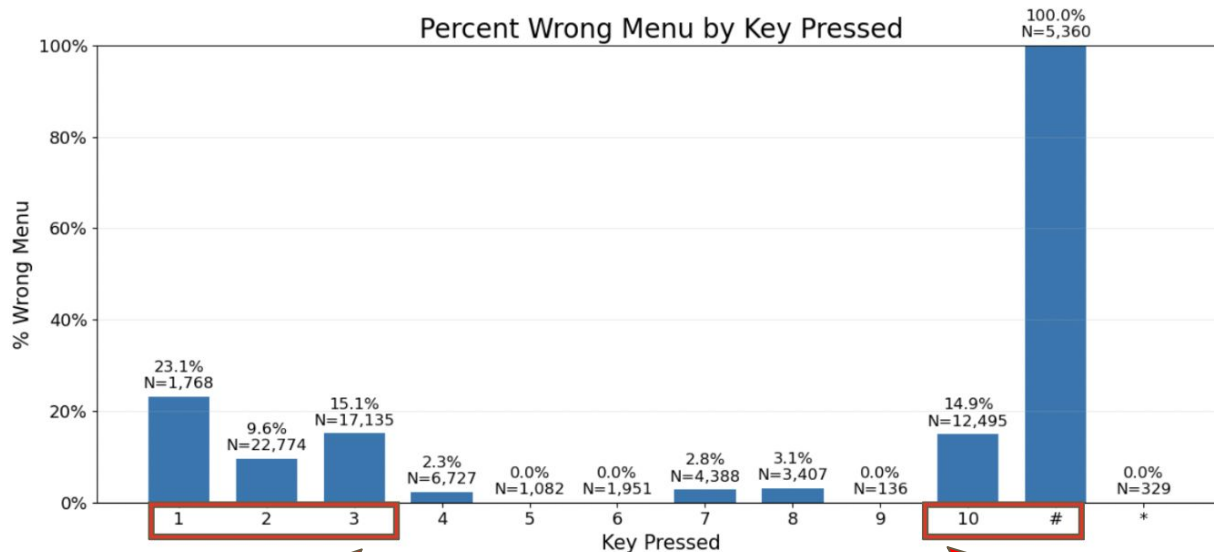

→ **Rephrase Key 3 verbiage to consolidate the two that are both asking if the issue is a legal problem**

Legal Menu Analysis

Legal Menu Analysis Recall

**Menus of
interest**

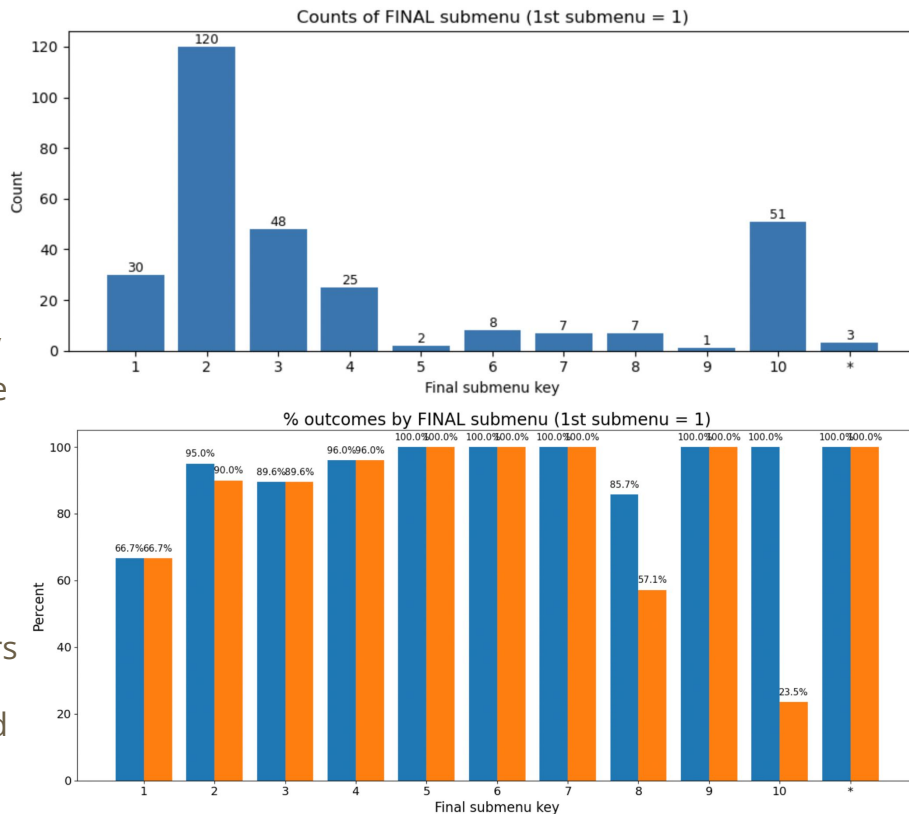

1. HIV
2. Family
3. Housing
4. Benefits
5. Consumer(SP) Queue
6. Criminal Records Voicemail
7. Employment
8. Immigration
9. ADAPT(SP) Queue
10. Other Legal

#/no/invalid input.
Legal Menu (again)

*. Front Desk Transfer

Final LegalMenu submenu after first choosing HIV

- Majority enter different submenu than HIV
- Consistent with overall submenu distribution
- Suggesting the 23.1% choosing HIV as 'wrong menu' are simply pressing key way too early
- Higher rates of successful calls also indicate these callers are not confused (rather they pressed 1 too quickly)

1. HIV
2. Family
3. Housing
4. Benefits
5. Consumer(SP) Queue
6. Criminal Records Voicemail
7. Employment
8. Immigration
9. ADAPT(SP) Queue
10. Other Legal

#/no/invalid input.
Legal Menu (again)

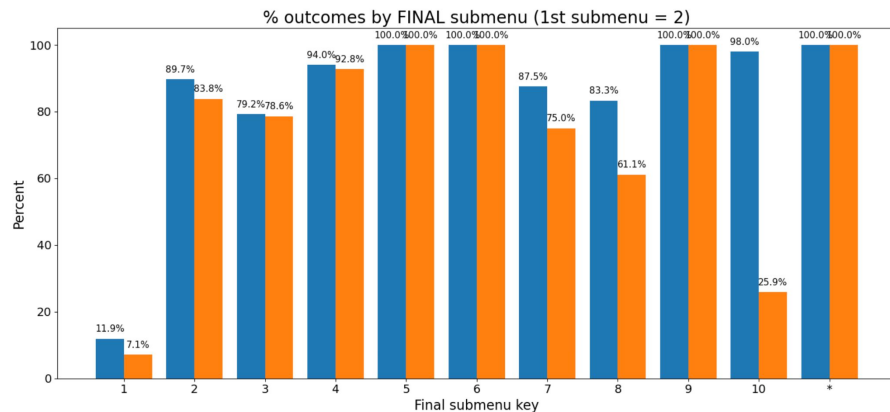

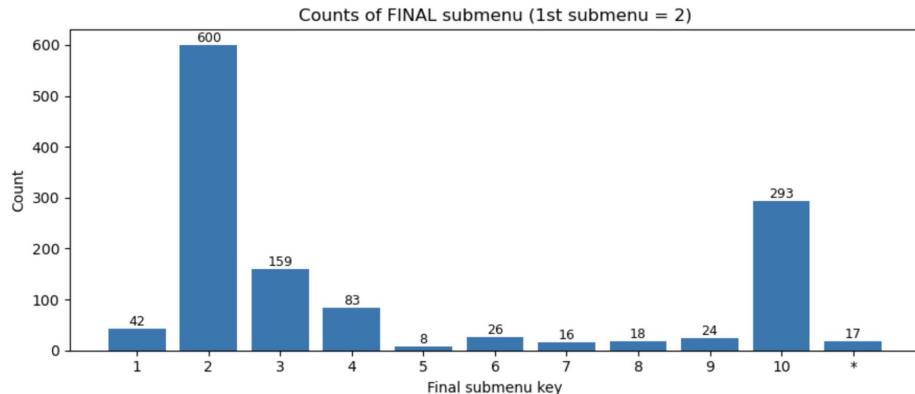

*. Front Desk Transfer

Final LegalMenu Submenu after first choosing Family

- Vast majority reenter Family menu, or go to other legal menu

- Other legal: Individuals with family-adjacent issues not serviceable in family menu

- Very high rate of successful calls (90%) despite large number of callers revisiting family menu again

1. HIV
2. Family
3. Housing
4. Benefits
5. Consumer(SP) Queue
6. Criminal Records Voicemail
7. Employment
8. Immigration
9. ADAPT(SP) Queue
10. Other Legal

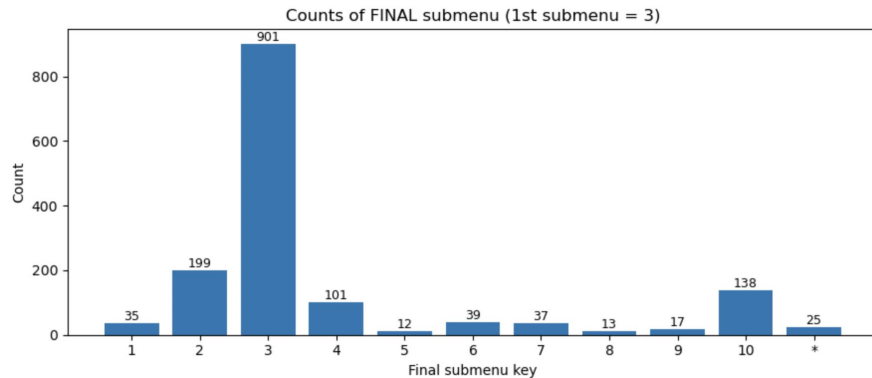

#/no/invalid input.
Legal Menu (again)

*. Front Desk Transfer

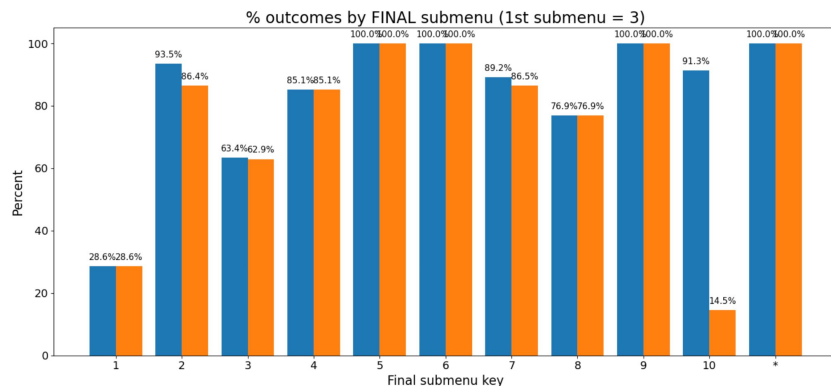

■ % Call_successful
■ % Reached_queue

Final LegalMenu Submenu after first choosing Housing

- Vast majority reenter housing submenu

- Significant number of calls never reach a queue in the housing submenu (~37%)

1. HIV
2. Family
3. Housing
4. Benefits
5. Consumer(SP) Queue
6. Criminal Records Voicemail
7. Employment
8. Immigration
9. ADAPT(SP) Queue
10. Other Legal

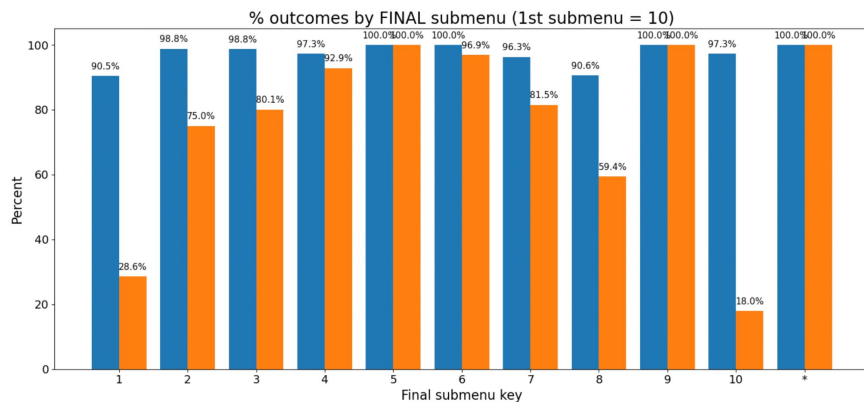

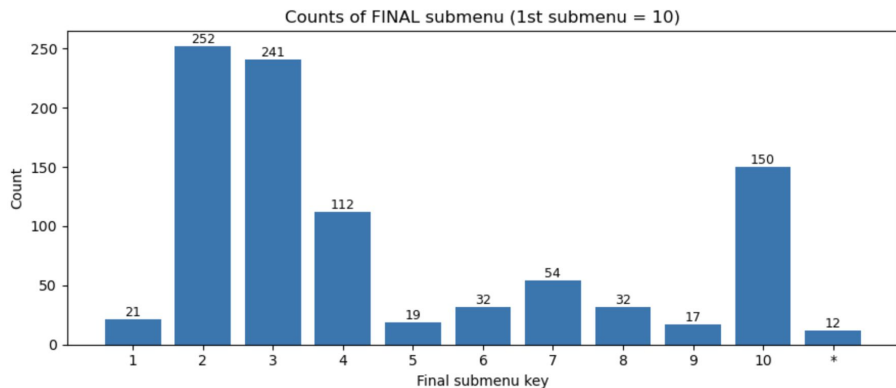

#/no/invalid input.
Legal Menu (again)

*. Front Desk Transfer

■ % Call_successful
■ % Reached_queue

Final LegalMenu Submenu after first choosing Other

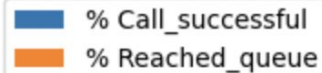

- Vast majority already reached dead-end in other legal menu, but then most continued the call journey to a queue in another menu

1. HIV
2. Family
3. Housing
4. Benefits
5. Consumer(SP) Queue
6. Criminal Records Voicemail
7. Employment
8. Immigration
9. ADAPT(SP) Queue
10. Other Legal

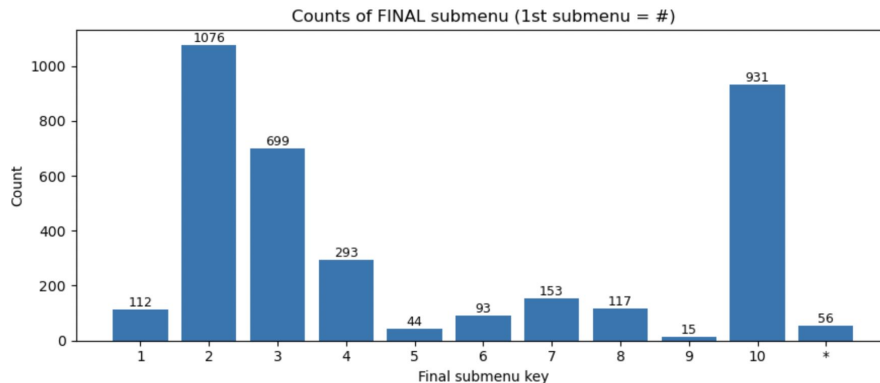

#/no/invalid input.
Legal Menu (again)

*. Front Desk Transfer

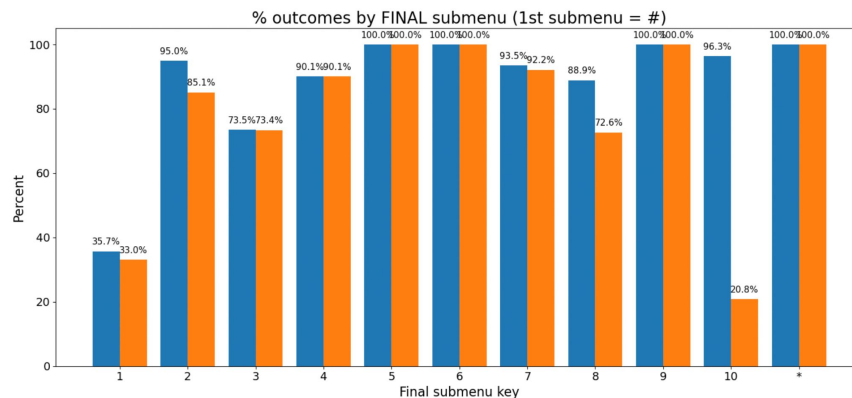

Final LegalMenu Submenu after directly repeating prompt

- No submenus that are disproportionately receiving traffic from repeat prompts (compared to overall distribution)
 - Except for other legal menu

- HIV with very low percent entering queue
 - Like before, presence of people just choosing #1
- Housing menu also with lower queue rate (73%)

1. HIV
2. Family
3. Housing
4. Benefits
5. Consumer(SP) Queue
6. Criminal Records Voicemail
7. Employment
8. Immigration
9. ADAPT(SP) Queue
10. Other Legal

#/no/invalid input.
Legal Menu (again)

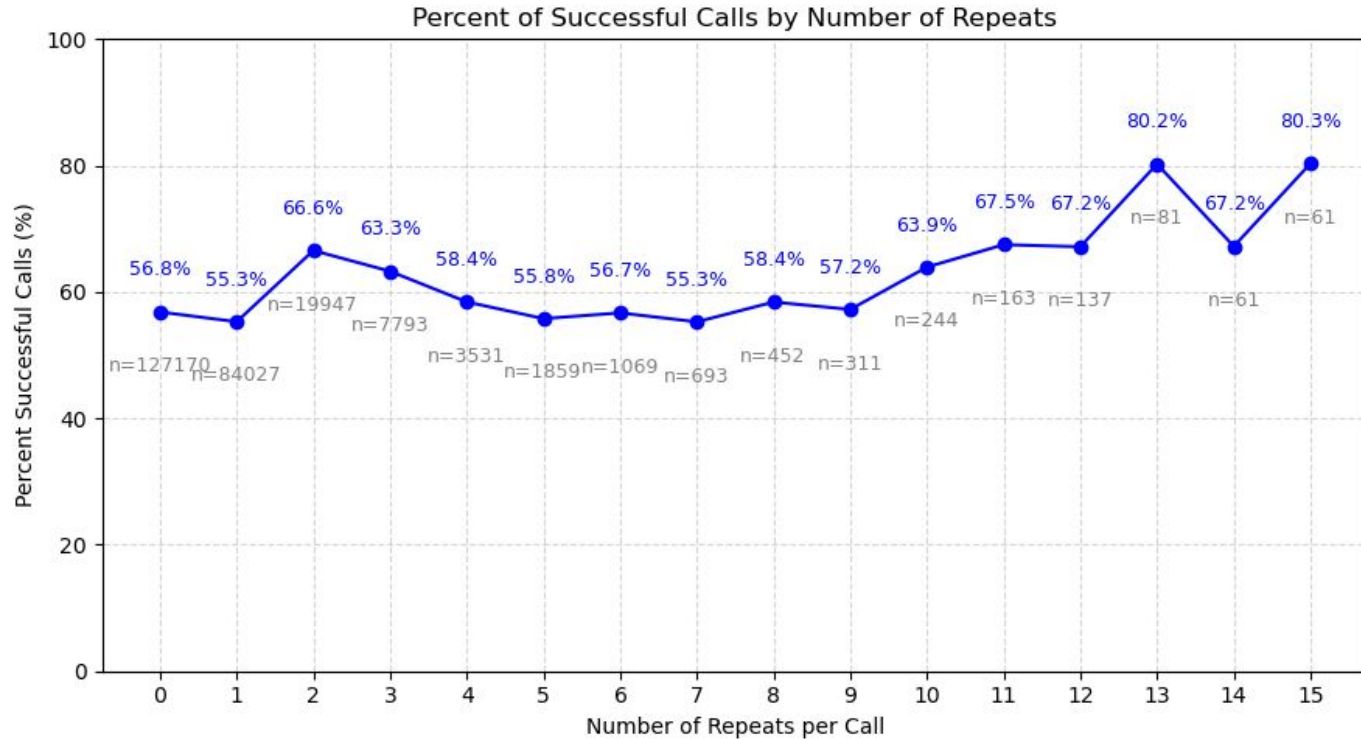

*. Front Desk Transfer

■ % Call_successful
■ % Reached_queue

Reflection / Next Steps

- Significant difference in percent of successful calls for those returning to legal menu among those listening to full prompt (80%) vs not listening to full prompt (63%)
 - Next step: understand why
 - Potential reason: large group chooses housing submenu and then reenters (combined with lower call success rate)
- Lowest success rate in HIV menu
 - Mostly attributable to impatient callers? (as #1 option)
 - Next step: How much time do these callers spend in HIV menu and previous submenus?
- Almost $\frac{1}{3}$ callers swap from family to other legal menu
 - Next step: verbiage analysis of family and other legal menu
 - What family-adjacent issues are not directly serviceable in family submenu?
- Housing submenu issues? (Lower success rate)
 - Next step: housing submenu verbiage analysis

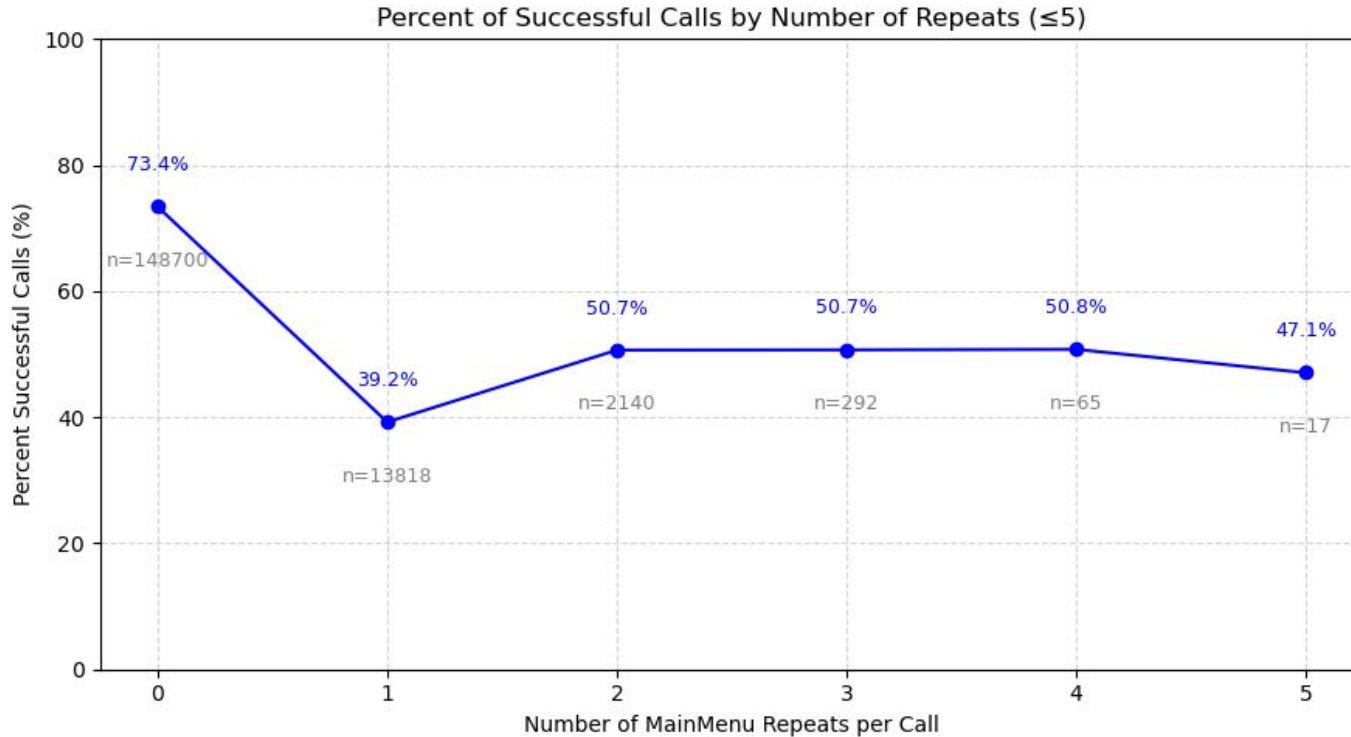

Does prompt repetition increase the probability of success?

Repeats = total number of repeats across all prompts in a single call

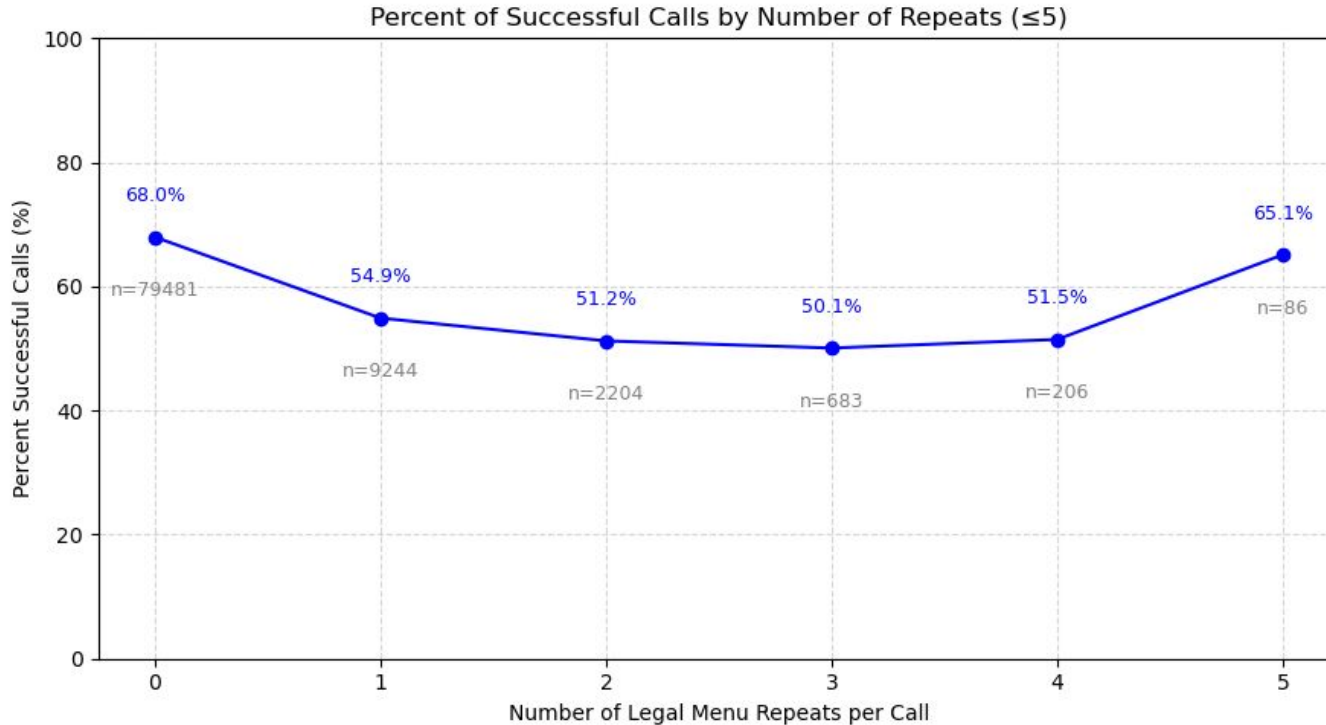

- **0-1 repeats:** lowest success rate.
- **2-3 repeats:** rise in success rate.
- **3-9 repeats:** Confusion/frustration
- **> 9 repeats:** highly persistent callers, high success rate.

Main Menu

- Success rate is strictly lower for callers who repeat vs. callers who don't

Legal Menu

- Similar to Main Menu, success rate is lower for callers who repeat vs. callers who don't

***Note:** Data includes only callers who visit the Legal Menu.

Summary

Observation 1

For Main and Legal Menu, repeating the prompt is associated with a lower chance of a caller reaching the queue. Repetitions may discourage callers to stay on the line until they reach a queue. **We need to make repetitions convenient and easy.**

Observation 2

However, at the call level, a small number of total repetitions is associated with higher success rates, compared to callers who don't repeat, and callers who repeat excessively. **An effective number of repetitions may be helpful, and we need to identify what kind of repetitions these are.**

Next Steps

- Identify the specific prompts that are associated with helping the user end up in a queue, which aren't, and how we can optimize prompts to make repetitions easy.
- Repetition can be better contextualized within a call, which leads us to examine paths.
 - Define a **path** for a given call as a sequence of nodes, *[node1→node2→... → node_n→queue/abandon]*
- Then, compare paths between 2-3 repeats and 0-1 repeats, to see which additional repeats might be leading to a higher success rate.
- Similarly, for paths with high number of repeats (>3), identify which patterns exist in the paths of these confused callers.

Thank You!
